#### What is energy storage and how does it work?

When the wind is blowing or the sun is shining, the electricity that is produced must either be used or lost. On the other hand, when it's cloudy or the wind isn't blowing, power may not be available to meet demand. Energy storage addresses this problem by capturing excess energy during productive times and releasing it during leaner times.

Is abandoning wind power more economical than energy storage?

In WSST Project, the average charge-discharge cost of LiB is about 1.5 yuan/kW·h each time which is higher than the peak power price. Therefore, abandoning wind power is more economical than equipping with energy storage system. In fact, energy storage is now still at the stage of demonstration, the earnings are little . 3.2.

How will res' grid connection affect energy storage demand?

And the pressure of RES' grid connection will also force the acceleration of wind-solar energy storage. It is predicted that with the continuous development of smart grid and RES' grid connection, energy storage demand during the "13th Five-Year" will further arise and reach to 50 billion yuan in year 2020.

### Why is energy storage industry in China a big problem?

Judging from the present condition, cost problem is the main barrier. And the high performance and high security of the relative technology still need to be improved. Until 2020, energy storage industry in China may not be spread massively and the key point during this period is the technology research.

Is energy storage a precondition for large-scale integration and consumption?

So to speak, energy storage is the precondition of large-scale integration and consumption of RES. However, China's energy storage industry is at the exploration stage and far from commercialization. This restricts the development of RES to certain extent. For this reason, this paper will concentrate on China's energy storage industry.

What challenges do energy storage resources face?

Energy storage resources present a distinct set of challenges given their unique nature: unlike conventional or renewable generation, energy storage resources must be charged with electric power, which will sometimes (but not always) be provided by the offtaker.
