# **SOLAR** PRO. Non-linear resistor energy storage

#### What is a non linear resistor?

Non-linear resistors are resistive components where its resistance is not behaving linearly with parameterssuch as voltage, current (varistors), temperature (thermistors), or it depends to the previous stage (memristors).

#### What is the difference between a linear resistor and a varistor?

It can be seen that the voltage curvefor a varistor is very different to that of a linear resistor. The discharge time for a varistor is much shorter - usually  $\sim 30\%$  of the linear discharge time. Metrosil varistors enable superfast energy discharge for high energy applications worldwide.

#### How reliable are non-linear resistors?

The reliability of non-linear resistors, including varistors, is today regarded as relatively good. It depends on serious manufacturers using SPC-based production programs and having verified type approvals. Examples of climatic category classified products 40/125/56 indicate good quality.

#### What is non-linear resistance?

The non-linear resistance behaviour is successfully used to get specific features like sensors, limiters, ESD protection, self-balancing temperature stabilisation etc., using still a relatively simple and reliable passive component.

### How does a thermistor reduce resistance?

The reduced resistance is achieved by a construction that connects "resistor elements" in parallel inside the thermistor body. NTC stands for negative TCR (Negative Temperature Coefficient). The temperature dependence is strong and exponential and follows the formula: Thermistor temperature dependence equation

### What is a memristor resistor?
