Or a circuit containing an energy storage element

What is the difference between a resistor and a storag element?

electric and magnetic duals of each other, di er from resistors in several signi cant ways. Unlike resistors, which dissipate energy, capacit rs and inductors do not dissipate but store energy, which can be retrieved at a later time. They are called storag elements. Furthermore, their branch variables do not depend algebra

How does a capacitor store energy?

itors6.2.1. A capacitor is a passive element designed to store energy in i s elec ric eld. The word capacitor is derived from this element's capacity to store energy.6.2.2. When a voltage source v(t) is connected across the capacitor, the amont of charge stored, represented by q, is directly proportional to v(t), i.e., q(t) = C

Do storag elements depend on each other?

but store energy, which can be retrieved at a later time. They are called storag elements. Furthermore, their branch variables do not depend algebra cally upon each other. Rather, their relations involve temporal deriva-tives and integrals. Thus, the anal sis of circuits containing capac-itors and intia equations in tim

Does a circuit have memory?
