Thermal energy storage (TES) is a technology that stocks thermal energy by heating or cooling a storage medium so that the stored energy can be used at a later time for heating and cooling applications and power generation. TES systems are used particularly in buildings and industrial processes. In these applications,

However, today's TES systems are hampered by low energy density, and may thus be large and voluminous. One of the new routes currently explored is thermochemical energy storage (TCES), which can offer more ...

The wells are used as an energy source for district heating production through heat pumps. Excess heat from district cooling systems is returned, stored in the energy wells, and reused when heat is needed. "The thermal energy from the wells generates 2.5 MW, which, in context, meets the needs of approximately 800 single-family homes," says Kolstad.
