What are salt based and paraffin based PCMs?

Salt-based and paraffin-based PCMs are the common solid-liquid PCMs applied in thermal energy storage systems. Salt-based PCMs undergo the problems including subcooling, phase separation, and metal corrosion during melting.

Numerical methods have obtained results for the fluid flow field, neither the cylinder nor cavity structures. The transient melting process is controlled by conduction and natural convection. [25]. For cylinder structures, a major thermal stratification was caused in the upper energy storage part [26].
