

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What is phase change material (PCM) based thermal energy storage?

Bayon, A. · Bader, R. · Jafarian, M. ... 86. Phase change material (PCM)-based thermal energy storage significantly affects emerging applications, with recent advancements in enhancing heat capacity and cooling power.

Can spatiotemporal phase change materials be used for solar thermal fuels?

In a recent issue of *Angewandte Chemie*, Chen et al. proposed a new concept of spatiotemporal phase change materials with high super-cooling to realize long-duration storage and intelligent release of latent heat, inspiring the design of advanced solar thermal fuels.

How to integrate phase change materials with building walls?

Generally speaking, there are two ways to integrate phase change materials with building walls: "immersion" and "attachment". The solution of "immersion" is to integrate the phase change materials with the construction material of the building envelope, such as concrete, bricks and plaster.

What temperature should a PCM have a phase change?

For this purpose, the material should have a phase change between 100 and 220 °C with a high latent heat of fusion. Although a range of PCMs are known for this temperature range, many of these materials are not practically viable for stability and safety reasons, a perspective not often clear in the primary literature.
