

How do photocatalytic materials and energy storage materials work together?

It has commonly been achieved by the combination of photocatalytic materials and energy storage materials, in which energy storage materials can store the excess photogenerated carriers from photocatalytic materials in the presence of light and release these stored carriers in the absence of light (Tatsuma et al., 2002).

Which energy storage material is used in photocatalysis?

To date, several energy storage material systems have been developed, such as TiO_2 - WO_3 1,2,3,4,6,7,8,9, TiO_2 - MoO_3 10, $\text{Au}:\text{TiO}_2$ - WO_3 5, $\text{Au}:\text{TiO}_2$ - MoO_3 5, SrTiO_3 - WO_3 11, TiO_2 - $\text{Ni}(\text{OH})_2$ 12,13 and TiO_2 - V_2O_5 14, which have been widely used in photocatalysis, anticorrosion and sterilization in dark.

Can light-activated phase change materials control heat storage and triggered release?

Sunlight-activated phase change materials for controlled heat storage and triggered release. J. Mater. Chem. A. 2021; 9: 9798-9808 Arylazopyrazoles for long-term thermal energy storage and optically triggered heat release below 0 °C.

Why do photo-charged catalysts have a dark storage duration?

The dark storage duration of these photo-charged catalysts is primarily dependent on the electron release rate from the various energy storage materials. And it is influenced by the surrounding environment, involving oxygen content, humidity, and so on. The duration is speculated to be shortened when the air humidity and oxygen content increases.

Which light harvesting materials are used in solar energy storage systems?

Whereas the variety of the material system has been rapidly developed, the most frequently used light harvesting material is still TiO_2 . Thus, in most energy storage systems, UV light is used for illumination. To use the solar energy more efficiently, a few visible light harvesting materials 5,15 have been investigated recently.

How does a photocatalyst work?

Theoretically speaking, when in the presence of light with sufficient energy ($h\nu \geq E_g$), the conventional photocatalyst starts working to generate charge carriers for catalyzing redox reactions and at the same time the energy storage material stores the excess generated charge carriers.

This work explores Photo-Induced Enhanced Raman Spectroscopy (PIERS) as a tool to investigate charge carrier dynamics in nanometer-thick Ag-TiO₂ heterojunctions with a Schottky barrier. Due to the light-induced charge transfer process at the semiconductor-metal interface, PIERS provides a significant signal enhancement over traditional Surface-Enhanced ...

With the increasing demand for sustainable energy and environment, continuous photocatalysis with energy

storage/release ability has emerged as a promising alternative for ...

This study identified photo-induced proton transfer (photo-induced PT) as a significant process in photo-(dis)charging of widely-used V_2O_5 -based zinc-ion batteries, contributing to enhanced capacity under illumination but ...

We showed that both phenomena can be probed by in situ PIERS spectroscopy. This proof-of-principle paves the way for developing more advanced photoactive ...

the 365 nm UV light can irradiate only through the white regions within the input black-and-white pictures, leading to an emission turn-off in the corresponding area in the film which is caused by the UV-induced energy transfer as discussed above. By utilizing various input electronic pictures in this DMD system, arbitrary

After the detailed demonstration of some photo-assisted energy storage devices examples, the bottleneck of such light-assisted energy storage devices is discussed and the prospects of the ...

The photo-induced process has in general been reported as more efficient in reaction rates compared to the thermally mediated RAFT process [59, 81]. Although, the intensity and the frequency of the light energy employed for the process are significant in the decomposition of the RAFT agent and the fast-tracking of side-chain reactions [82].

In this work, WO_3 - TiO_2 - $BiVO_4$ nanocomposite photoanodes are prepared, enabling photoelectrochemical cathodic protection (CP) under visible light illumination, while the energy self-storage capability makes the photo-induced CP functional in darkness. The outer $BiVO_4$ layer causes an enhanced optical absorption of visible light for photoelectrochemical ...

The aligned energy levels with type II band structure ensures effective transfer of photo-generated holes from CdSe (-5.71 eV) to higher valence band of NFPP (-5.10 eV). ...

Energy conversion is a prime concern of the scientific community and industrial sectors around the world 1,2,3. Among the various stimuli, light is a clean energy source which is both safe and ...

In addition, the photo-reactivity of these incorporated photochromophores in OLEDs make the photo-patterning of the light-emitting devices easily available, which can find good signage applications such as warning signs, indicators, decorative light sources, advertising, and logo displays [35], [36], [37]. However, this image procedure generally demands irradiation ...

Compared with recently reported materials for photo-assisted energy storage, such as $Se-V_2O_5$ -PPy with capacitance of ... WN2 showed quit stable intrinsic capacitance in dark and photo-induced capacitance enhancement during the durability study. ... Computational-guided design of photoelectrode active materials

for light-assisted energy ...

The rational design of a graphitic carbon nitride-based dual S-scheme heterojunction with energy storage ability as a day/night photocatalyst for formic acid dehydrogenation ... of 3919 h⁻¹ under visible light irradiation, which was 6-, 5.2- and 24 ... the IEF at the hetero-interface drives the fast consumption of the photo-induced holes in ...

Molecular solar thermal (MOST) energy storage materials enable the storage of photon energy within their chemical bonds and the release through external stimulation. ...

Molecular solar thermal (MOST) energy-storage materials are a class of compounds that store photon energy in chemical bonds upon photoconversion, which releases as heat during reversion when triggered by ...

Here we report, a Pt-loaded and hydrogen-treated WO₃ that exhibits a strong absorption at full-sunlight spectrum (300-1,000 nm) and with a super-long energy storage time ...

For molecular solar thermal (MOST) systems, the energy storage density, energy conversion efficiency, and energy storage time are the major figures of merit, which can be optimized by the judicious molecular designs and fine-tuning their optical and thermal properties (Figure 1 B). A large energy storage density can be acquired by designing switches of small ...

This study represents a pioneering exploration into the storage of photo-generated electrons by V₂O₅ / g-C₃N₄, offering significant potential to enhance the comprehensive utilization of visible light and advance research in day ...

Molecular solar thermal (MOST) energy-storage materials are a class of compounds that store photon energy in chemical bonds upon photoconversion, which releases ...

Stilbenes (Fig. 2) are a class of organic compounds which undergo a E-Z photoisomerisation when exposed to light in the range 300-700 nm, making them interesting compounds with regard to solar energy storage since some derivatives absorb light well into the visible part of the solar spectrum. A major drawback, however, is the low storage enthalpy ...

Titanium dioxide (TiO₂) as a photocatalyst received remarkable attention owing to its potential applications in environmental remediation and energy production. TiO₂ owns an indirect band gap of ~ 3.2 eV, chemical stability, photocorrosion resistant, low toxicity and the photocatalyst is sensitive to ultraviolet (UV) light, which is < 5.0% of the overall solar intensity ...

Reductive energy from visible light-responsive Au-TiO₂ photocatalyst, which is based on plasmon resonance absorption of Au nanoparticles, can be stored in WO₃ as a reductive energy storage material. About 60% of the charge stored in WO₃ is consumed on the WO₃ and the other 40% is on the Au-TiO₂ by reduction of

ambient O₂. Electrochemically ...

Solar energy is a clean and inexhaustible source of energy, among other advantages. Conversion and storage of the daily solar energy received by the earth can effectively address the energy crisis, environmental pollution and other challenges [4], [5], [6], [7]. The conversion and use of energy are subject to spatial and temporal mismatches [8], [9], ...

Zinc-ion capacitors have emerged as a promising energy storage technology that offers a favorable balance between energy and power density, as well as excellent safety and cyclic life [26, 27] allowing light to be used to recharge the zinc-ion capacitors directly, Michael De Volder and colleagues proposed photo-rechargeable zinc-ion capacitors, wherein graphitic ...

About 1275 % light-induced energy density enhancement was recorded for the MBI:CPH-G photo-supercapacitor. The device shows excellent cyclic charge-discharge stability, retaining 94.79 % of its initial capacitance after 5000 cycles. ... The nanopores are beneficial to the capacitive energy storage potential of the MBI photo-capacitive ...

Persistent materials are defined as a group of materials which show persistent luminescence from seconds to years after the removal of excitation sources like ultraviolet light, electron beams or some high energy radiation beams such as X-, α -, γ - or ν -rays [[1], [2], [3], [4]]. This phenomenon is also called long afterglow, phosphorescence or long lasting glow, and ...

Photo-induced energy transfer within donor-acceptor dipeptides: Towards an artificial light-harvesting hydrogel system. Author links open ... Carbohydrate synthesis in plants and bacteria occurs in a light-harvesting system that is induced by light absorption, followed by efficient transfer of the excitation energy of a donor to an acceptor ...

Here, we report a high-energy organic phase change composite (PCC) by introducing long-chain azobenzene molecule (AZO) into low-cost tetradecyl alcohol (TA) for light-regulated solar energy storage and release. The photo-switch azobenzene can install a new energy barrier and form a supercooling in liquid-phase charged PCC via molecular photo ...

The utilization of solar energy is restricted by the intermittent nature of solar influx. We present novel noble-metal free complexes that can be photochemically charged in the presence of sacrificial electron donors and ...

Even though photo C-V was detected in some solar cells during recent years [13-19], the energy and charge conversion during photo C-V was not digged. Luckily light-induced capacitance depend on open-circuit voltage, V_{oc} , was observed in solar cells [17,19], but energy and charge capture was not discussed.

In this work, WO₃-TiO₂-BiVO₄ nanocomposite photoanodes are prepared, enabling photoelectrochemical

cathodic protection (CP) under visible light illumination, while ...

(a) Schematic diagram of energy storage with UV light (365 nm) irradiation and release at 25 °C induced by blue light (420 nm). IR thermal-imaging of the charged (b) T-Azo and (c) F-Azo by blue light irradiating. (For interpretation of the references to color in this figure legend, the reader is referred to the Web version of this article.)
