Yet, this conclusion only holds for combinations examined most recently or stacking several business models. Many technologically feasible combinations have been neglected, profitability of energy storage.

How does stacking affect profitability?

Capacity cost refers to the cost of energy storage battery and power cost refers to the cost of power conversion system (PCS):
$$C_2 = (C_{EE} E_{ba} + C_{PP} P_{ba}) r (1 + r)^{m-1} (1 + r)^{m-1} - 1$$
 where C_{EE} is the unit price of energy storage capacity; E_{ba} is the energy storage capacity; C_{PP} is the unit price of energy storage power; P_{ba} is the ...

the customer-sited storage target totals 200 megawatts (MW). California has also instituted an incentive program for energy storage projects through its Self-Generation Incentive Program (SGIP) [2]. 2014 incentive rates for advanced energy storage projects were \$1.62/W for systems with up to 1 MW capacity, with declining rates up to 3 MW.

The ESS can not only profit through electricity price arbitrage, but also make an additional income by
