

What is a semi-solid lithium slurry battery?

A semi-solid lithium slurry battery is an important development direction of lithium battery. It combines the advantages of traditional lithium-ion batteries with high energy density and the flexibility and expandability of liquid flow batteries, making it suitable for energy storage applications.

Are lithium slurry Batteries A Next-Generation RFB?

Lithium slurry batteries (LSBs) are identified as next-generation RFBs because it can overcome the energy density limitations in RFBs [4,5]. Meanwhile, LSBs combine the high energy density of traditional lithium-ion batteries (LIBs) with the mutual energy and power energy independence of RFBs, allowing for higher voltage than RFBs [6].

Does lithium slurry battery release more heat than lithium ion battery?

In comparison, the semi-solid lithium slurry battery released slightly more heat than the lithium-ion battery in charging, however less heat in discharging. The heat generation rate of the semi-solid lithium slurry battery continues to increase until the end, while the lithium-ion battery reached its peak at 80% depth of discharge (DOD).

What is a slurry based lithium-ion flow battery?

A slurry based lithium-ion flow battery is a type of battery that uses a liquid slurry of lithium iron phosphate (LiFePO_4 or LFP) as its electrolyte. This battery features a serpentine flow field and a porous carbon felt electrode design. The schematic illustration shows an example of this concept using LFP slurry.

What is the heat generation rate of a lithium slurry battery?

In the process of charging, the heat generation rate of a semi-solid lithium slurry battery increases rapidly between 0% and 10% SOC, then slows down until 70% SOC. After that, it continues to increase until the end, unlike a lithium-ion battery which reaches its peak at 85% SOC.
