Can Li 6 Ps 5 Cl anode improve contact between lithium metal and lm@li?
Herein, we report a liquid metal-coated lithium metal (LM@Li) anode strategy to improve the contact between lithium metal and a Li 6 PS 5 Cl inorganic electrolyte. The LM@Li symmetric cell shows over 1000 h of stable lithium plating/stripping cycles at 2 mA cm -2 and a significantly higher critical current density of 9.8 mA cm -2 at 25°C.

Are lithium metal batteries suitable for electrochemical energy storage?
Abstract Lithium metal batteries with inorganic solid-state electrolytes have emerged as strong and attractive candidates for electrochemical energy storage devices because of their high-energy con...

How wettability and stability of lithium metal and electrolyte interface can be achieved?
Herein,we show that the wettability and stability of the lithium metal and electrolyte interface can be effectively achieved through the utilization of an ultrathin layer of GaInSn coated onto the lithium metal surface(Figure 1).

Can 3d-structured hosts improve the stability of lithium-based rechargeable batteries?
3D-structured hosts can play a significant rolein improving the stability of metal-based rechargeable batteries with high-energy density,such as lithium metal batteries (LMBs). Nevertheless,the equipotential nature of the host leads to Li accumulation on the top surface rather than on the inside surface,which degrades Li storage efficiency.

Are lithium metal batteries safe?
Lithium metal batteries (LMBs) have unparalleled high-energy-density,yet the threat of safety issues is significantly severedue to the potential high energy release of violent reactions between lithium metal and electrolyte under abusing conditions. Effective methods to mitigate the parasitic reactions are lacking.

What is a solid electrolyte interface (SEI)?
Constructing a robust solid electrolyte interface (SEI) physically diminishes the interaction between lithium metal and electrolyte, representing a feasible and effective approach to mitigate the aforementioned adverse reactions [16, , ,].

The exceptional compatibility with lithium metal, demonstrated by enhanced cycling stability and reduced combustion risks, positions TEOS/PFPN as a robust electrolyte choice. ...
