Refrigerators are cold storage cabinets used to store food. Run time ratio is an important factor contributing to the refrigerator energy consumption. An experimental study is presented, in which the parameters affecting the run time ratio of the freezer compartment of a "no-frost" household refrigerator is taken into account.

the flow of energy from the mains to the process. Energy is supplied to the process through the motor shaft. Two physical quantities describe the state of the shaft: torque and speed. To control the flow of energy we must therefore, ultimately, control these quantities. In practice, either one of them is controlled and we speak of

Flywheels are not suitable for long-term energy storage, but are very effective for load-leveling and load-shifting applications. Flywheels are known for their long-life cycle, high-energy density, low maintenance costs, and quick response speeds. Motors store energy into flywheels by accelerating their spins to very high rates (up to 50,000 rpm).
