Sodium-sulfur batteries differ from other regularly used secondary batteries due to their larger temperature operating range. Typically, these batteries function between 250°C and 300°C with molten electrode material and solid electrolyte [22] 1960, Ford Motor Company utilized sodium-sulfur batteries for the first time in a commercial capacity [23].

Molten Na batteries began with the sodium-sulfur (NaS) battery as a potential temperature power source high- for vehicle electrification in the late 1960s [1]. The NaS battery was followed in the 1970s by the sodium-metal halide battery (NaMH: e.g., sodium-nickel chloride), also known as the ZEBRA battery (Zeolite
