Where can energy storage be placed?

Sometimes energy storage is co-located with, or placed next to, a solar energy system, and sometimes the storage system stands alone, but in either configuration, it can help more effectively integrate solar into the energy landscape.

What is solar storage and how does it work?

Solar storage is a system that stores excess electricity produced by solar panels for later use. It works by converting the excess electricity into a form that can be stored, such as chemical energy in batteries. This stored energy can then be used whenever needed, including after the sun has set, acting as an insurance policy for sunshine.

When can stored solar energy be used?

When some of the electricity produced by the sun is put into storage, that electricity can be used whenever grid operators need it, including after the sun has set. In this way, storage acts as an insurance policy for sunshine.

What equipment is needed to go solar?

To go solar, you need solar panels, inverters, racking equipment, and performance monitoring equipment. Additionally, you might want to consider an energy storage system (solar battery), especially if you live in an area without net metering.
