Sensible heat thermal energy storage materials store heat energy in their specific heat capacity (C_p). The thermal energy stored by sensible heat can be expressed as $Q = m \cdot C_p \cdot \Delta T$, where m is the mass (kg), C_p is the specific heat capacity ($\text{kJ kg}^{-1} \text{K}^{-1}$) and ΔT is the raise in temperature during charging process.

Availability of thermal energy storage systems (TES) is a key to ensuring continuous power supply from solar thermal power plants. The application of sensible heat storage (SHS) in solid media is an attractive economic option, but is dependent on identifying suitable SHS media.
