Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [1]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air.

What is compressed air energy storage?

Compressed air energy storage (CAES) is the use of compressed air to store energy for use at a later time when required. Excess energy generated from renewable energy sources when demand is low can be stored with the application of this technology.

What are the options for underground compressed air energy storage systems?

There are several options for underground compressed air energy storage systems. A cavity underground, capable of sustaining the required pressure as well as being airtight can be utilised for this energy storage application. Mine shafts as well as gas fields are common examples of underground cavities ideal for this energy storage system.

Are compressed air energy storage systems suitable for different applications?

Modularity of compressed air energy storage systems is another key issue that needs further investigation in order to make them ideal for various applications. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Can a small compressed air energy storage system integrate with a renewable power plant?

Assessment of design and operating parameters for a small compressed air energy storage system integrated with a stand-alone renewable power plant. Journal of Energy Storage 4, 135-144. energy storage technology cost and performance assessment. Energy, 2020. (2019). Inter-seasonal compressed-air energy storage using saline aquifers.

Where is compressed air stored?

The compressed air is stored in a reservoir, typically a large underground cavern, where it can be stored for long periods until needed. When the electricity demand is high, the compressed air is released and passes through a turbine that generates electricity. The process of compressing air generates heat, which is normally wasted.
