

What is storage modulus?

Irfan Ahmad Ansari,... Kamal K. Kar Storage modulus is the indication of the ability to store energy elastically and forces the abrasive particles radially(normal force). At a very low frequency,the rate of shear is very low,hence for low frequency the capacity of retaining the original strength of media is high.

What is storage modulus & loss modulus?

The storage modulus can be used as a measure of the elastic component of the sample and similarly, the loss modulus - the viscous component of the sample. Whichever modulus is dominant at a particular frequency will indicate whether the fully structured material appears to be elastic or viscous, in a process of similar time scale.

Does the storage modulus change with frequency?

The storage modulus' change with frequency depends on the transitions involved. Above the T_g ,the storage modulus tends to be fairly flat with a slight increase with increasing frequency as it is on the rubbery plateau. The change in the region of a transition is greater.

What is dynamic modulus vs frequency?

Dynamic storage modulus (G') and loss modulus (G'') vs frequency (Dynamic modulus, n.d.). The solid properties of plastics are especially important during injection molding and extrusion. During injection molding, plastics with a large storage modulus tend to shrink more and to warp more after molding.

What is energy absorbing capacity / storage modulus?

This is called energy absorbing/storing capacity or storage modulus. As we increase frequency, the microstructure will gradually collapse to dissipate energy as a viscous response, hence loss modulus will increase. Moreover, the transition of solid like to liquid like response with frequency is a subject of research.

How does frequency affect loss modulus?

As we increase frequency,the microstructure will gradually collapse to dissipate energy as a viscous response,hence loss modulus will increase. Moreover,the transition of solid like to liquid like response with frequency is a subject of research. It may vary material to material based on their composition.

We've been discussing storage modulus and loss modulus a lot in the last few days.
