## The difference between air conditioning water energy storage and battery energy storage

What is the difference between cooling storage and battery?

Cooling storage is utilized to regulate the air conditioning cooling plant's demand, while the battery can adjust the entire electricity consumption. Furthermore, the cooling-plant data includes chillers, chilled and cooling water systems, which are not presented in Fig. 4 to avoid confusion.

Are liquid cooled battery energy storage systems better than air cooled?

Liquid-cooled battery energy storage systems provide better protection against thermal runawaythan air-cooled systems. "If you have a thermal runaway of a cell, you've got this massive heat sink for the energy be sucked away into. The liquid is an extra layer of protection," Bradshaw says.

What is the difference between thermal energy storage and batteries?

In summary, both thermal energy storage and batteries have their advantages and disadvantages. TES systems are better suited for storing large amounts of energy for longer periods, and are more durable and low-maintenance than batteries. However, batteries are more efficient and cost-effective, and are highly scalable.

Why is cooling storage weaker than a battery?

The technical weakness of cooling storage with respect to batteries exacerbates as the capacity increases. The regulatory performance of cooling storage is weaker than that of batteries, mainly due to the limitations imposed by building cooling load and power rating.

How flexible is cooling storage compared to batteries?

The following conclusions could be obtained based on the present study: In the long term, namely during the cooling season, the flexibility of cooling storage compared to batteries decreases with capacity, with an average discount ratio of 0.44-0.93.

What is the operational disparity between a battery and a cooling storage?

For a better exposition, the comparative analysis is conducted to describe the operational disparity, where the cold capacity is fixed at 30% of the design-day cooling load (51 MWh c) and the battery has the same capacity (14 MWh e). Fig. 5 illustrates the electricity consumption curves before and after programming by cooling storage or batteries.
