Is energy storage a profitable business model?

Although academic analysis finds that business models for energy storage are largely unprofitable, annual deployment of storage capacity is globally on the rise (IEA, 2020). One reason may be generous subsidy support and non-financial drivers like a first-mover advantage (Wood Mackenzie, 2019).

How do business models of energy storage work?

Building upon both strands of work, we propose to characterize business models of energy storage as the combination of an application of storage with the revenue stream earned from the operation and the market role of the investor.

Is energy storage a profitable investment?

profitability of energy storage. eagerly requests technologies providing flexibility. Energy storage can provide such flexibility and is attracting increasing attention in terms of growing deployment and policy support. Profitability of individual opportunities are contradicting. models for investment in energy storage.

Is energy storage a tipping point for profitability?

We also find that certain combinations appear to have approached a tipping point towards profitability. Yet, this conclusion only holds for combinations examined most recently or stacking several business models. Many technologically feasible combinations have been neglected, profitability of energy storage.

What is a business model for storage?

We propose to characterize a "business model" for storage by three parameters: the application of a storage facility, the market role of a potential investor, and the revenue stream obtained from its operation (Massa et al., 2017).

Can energy storage provide multiple services?

The California Public Utilities Commission (CPUC) took a first step and published a framework of eleven rules prescribing when energy storage is allowed to provide multiple services. The framework delineates which combinations are permitted and how business models should be prioritized (American Public Power Association, 2018).

Shared energy storage (SES). SES includes physical energy storage (PES) and virtual energy storage (VES). ... In the independent energy storage mode, each NEPS pursues its individual profit maximization goal, treating physical energy storage as an integral component rather than a separate entity. ... In the academic realm, scholars from various countries have conducted extensive research on different operational strategies [4, 5], revenue sources [6, 7], value allocation [8, 9], and economic evaluations [10, 11] of energy storage under different operation modes. Reference [4] establishes a performance evaluation index system for peer-to-peer energy sharing ...

According to Table 6, it can be seen that the focus of the energy storage business model is the profit model. China's electricity spot market is in the exploratory stage. In addition to "shaving peaks and filling valleys" and assisting renewable energy, the ancillary service market is the only way for energy storage to be profitable in the ...

In the context of the national "double carbon" strategy, the new energy has been developing rapidly. Since "electric energy" cannot be stored on a large scale, the power grid dispatching department needs to grasp the power generation status of new energy in real-time and adjust the thermal power, pumped storage, and storage resources according to the power ...

We propose to characterize a "business model" for storage by three parameters: the application of a storage facility, the market role of a potential investor, and the revenue stream obtained from its operation (Massa et al., 2017). An application represents the activity that an energy storage facility would perform to address a particular need for storing electricity over ...

However, the above model calculated the clearing price in advance based on the historical price data, a stochastic model for price prediction or robust optimization, and take it as a known quantity input to the arbitrage revenue model, that is, the energy storage system is a price-taker, whose operation decisions cannot affect the market ...

The value of energy storage has been well catalogued for the power sector, where storage can provide a range of services (e.g., load shifting, frequency regulation, generation backup, transmission support) to the power grid and generate revenues for investors [2]. Due to the rapid deployment of variable renewable resources in power systems, energy storage, as ...

In recent years, many provinces in China, such as Hebei, Shandong, and Liaoning, have issued grid-connection policies on the mandatory configuration of energy storage equipment for renewable energy sources [14], which stipulates that only WPGs with a certain proportion of energy storage capacity can be connected to the grid. Under these criteria, in order to obtain ...

Auxiliary services such as PM and FM are becoming increasingly popular in China due to its fast response time, high response accuracy, and low start-stop costs [[5], [6], [7], [8]]. Furthermore, as the status of independent energy storage in China is clarified, energy storage may be able to generate revenue by participating directly in the auxiliary services market.
