What are MW and MWh in a battery energy storage system?

In the context of a Battery Energy Storage System (BESS),MW (megawatts) and MWh (megawatt-hours) are two crucial specifications that describe different aspects of the system's performance. Understanding the difference between these two units is key to comprehending the capabilities and limitations of a BESS. 1.

What is energy storage capacity?

This can be compared to the output of a power plant. Energy storage capacity is measured in megawatt-hours(MWh) or kilowatt-hours (kWh). Duration: The length of time that a battery can be discharged at its power rating until the battery must be recharged.

What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability of a battery energy storage system (BESS), or the maximum rate of discharge it can achieve starting from a fully charged state. Storage duration, on the other hand, is the amount of time the BESS can discharge at its power capacity before depleting its energy capacity.

What is energy capacity?

Energy Capacity (MWh) indicates the total amount of energy a BESS can store and subsequently deliver over time. It defines the duration for which the system can supply power before recharging is necessary. For instance, a BESS with an energy capacity of 20 MWh can provide 10 MW of power continuously for 2 hours (since 10 MW × 2 hours = 20 MWh).

What determines the scale of a battery energy storage system?

Capacity and capabilitydetermine the scale of a battery storage system. However, there are several other characteristics that are important for calculating the marketability and return potential of a Battery Energy Storage System (BESS). Here are the most important metrics for BESS.
