

What is thermochemical energy storage (TCES)?

This chapter introduces the technical variants of TCES and presents the state of the art of this storage technology. Thermochemical energy storage (TCES) is considered the third fundamental method of heat storage, along with sensible and latent heat storage. TCES concepts use reversible reactions to store energy in chemical bonds.

What is thermochemical energy storage?

Thermochemical energy storage is quite a new method and is under research and development phase at various levels (Prieto, Cooper, Fernandez, & Cabeza, 2016). In this technique, the energy is stored and released in the form of a chemical reaction and is generally classified under the heat storage process.

How does thermochemical heat storage work?

Thermochemical heat storage works on the notion that all chemical reactions either absorb or release heat; hence, a reversible process that absorbs heat while running in one way would release heat when running in the other direction. Thermochemical energy storage stores energy by using a high-energy chemical process.

What is thermochemical energy storage (TCHS)?

In Thermochemical Energy Storage (TCHS) method, heat is stored as a reaction heat of a reversible thermochemical process [24]. It has a higher storage density than other types of TES, reducing the mass and space requirements for the storage.

How do you classify thermochemical energy storage?

Classification of thermochemical energy storage by the reaction type. Thermochemical storage materials should be characterized by a suitable reaction temperature and enthalpy for the application. Further material requirements are listed in Section 1.1.

How long can thermal energy be stored?

Depending on the application, and based on thermophysical and thermochemical reactions, thermal energy can be stored for short or long periods. There are three types of TES technologies: Sensible heat storage (SHS), latent heat storage (LHS), and Thermochemical energy storage (TCES).
