On the other hand, a high ratio of the electricity load of distributed energy systems comes from the air conditioner for meeting heat or cold load (e.g. in a commercial building), while the storage device prices of heat and cold are far cheaper than batteries [[18], [19], [20]]. Therefore, the utilization of heat and cold energy storage in the distributed energy system ...

The energy may be used directly for heating and cooling, or it can be used to generate electricity. In thermal energy storage systems intended for electricity, the heat is used to boil water. The resulting steam drives a turbine and produces electrical power using the same equipment that is used in conventional electricity generating stations.

The disadvantage of this is that you further limit the amperage current. You can still use a step-up converter to power small electronic devices. Some people also use the thermoelectric generator to make a heat powered ...

The integration of variable renewable energy sources requires additional flexibility in the power system as the feed-in patterns of wind and solar power are only partly correlated with electricity demand [6], [7], [8].
