Batteries, solar cells, and fuel cells are the majority of energy-generation/storage devices produced by the AM methods, and PBF and VP are the most used to produce them. This might imply that there is a high market demand for these energy devices and the machines used to produce them.

How are energy devices made?

Traditional manufacturing methods for the production of energy devices and their parts include melt spinning, injection molding, solution casting, electrospinning, spin coating, sputtering, electrochemical deposition, and chemical vapor deposition [10, 11].

How to develop electrochemical energy storage devices with low cost and high performance?

Research shows that the traditional powder electrode with active material coating is high in production cost, low in utilization rate of the active material, has short service life and other defects. Therefore, the key to develop electrochemical energy storage devices with low cost and high performance is to find suitable new electrode materials.
