The utilization of the gravity to store energy of any form is an idea in its infant stage[4]. Study shows that the pumped hydroelectric storage system (PHES) still remains the current most harnessed form of storage in the world on a long term and on a large scale [5].

Which material should be used for gravity storage?

The most suitable material for gravity energy storage, according to the discussed criteria, is reinforced concrete. The system structure should resist internal and external loads and have a long lifetime.

What is solid gravity energy storage technology (SGES)?

Solid gravity energy storage technology (SGES) is a promising mechanical energy storage technologysuitable for large-scale applications. However, no systematic summary of this technology research and application progress has been seen.

What is the difference between equipment cost and gravity storage?

The cost of the equipment refers to the cost of the machine sets consisting of pump/turbine and motor/generator. Gravity storage,like pumped hydro storage,requires similar mechanical equipment,including pump,turbine,and motor/generator. Several types of turbines can be used to convert kinetic energy,of the falling water,to rotational energy.
