Gye et al. (2019) conducted a risk evaluation of a high-pressure HRS with the quantitative point of view. Their results suggested that the immature hydrogen storage/transportation technology (trailer and dispenser leaks and the potential explosion of the trailer) are major risk factors.

It is a chemical process that releases large amounts of energy. Thermal runaway is strongly associated with exothermic chemical reactions. If the process cannot be adequately cooled, an escalation in temperature will occur fueling the reaction. Lithium-ion batteries are electro-chemical energy storage devices with a relatively high energy density.

Potential Hazards and Risks of Energy Storage Systems The potential safety issues associated with ESS and lithium-ion batteries may be best understood by examining a case involving a major explosion and fire at an energy storage facility in Arizona in April 2019, in which two first responders were seriously injured. ...
