Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [1]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air.

How is energy stored in a low demand space?

In low demand periods, energy is stored by compressing air in an air tight space (typically 4.0~8.0 MPa) such as an underground storage cavern. To store energy, air is compressed and sealed in the space. To extract the stored energy, compressed air is drawn from the storage vessel, mixed with fuel, and then combusted. The expanded air is then passed through a turbine.

What are the different types of energy storage?

The passage mentions two types of energy storage: 1. Compressed Air Energy Storage (CAES) and 2. Advanced Adiabatic Compressed Air Energy Storage (AA-CAES). CAES plants store energy in the form of compressed air.

What is a compressed air energy storage system?

A compressed air energy storage system works by storing pressurized air in volumes. When there is a high demand for electricity, the pressurized air is used to run turbines to generate power. There are three main types of systems used to manage heat in these systems.

Where will compressed air be stored?

In a Compressed Air Energy Storage system, the compressed air is stored in an underground aquifer. Wind energy is used to compress the air, along with available off-peak power. The plant configuration is for 200MW of CAES generating capacity, with 100MW of wind energy.

What is the typical pressure used in compressed air energy storage?

During the operation, excess electricity is used to compress the air into a salt cavern located underground, typically at depths of 500-800 m and under pressures of up to 100 bars. Diabatic storage systems utilize most of the heat using compression with intercoolers in an energy storage system underground.

Compressed air energy storage (CAES) is a method of compressing air when energy supply is plentiful and cheap (e.g. off-peak or high renewable) and storing it for later use. The main application for CAES is grid-scale energy storage, although storage at this scale can be less efficient compared to battery storage, due to heat losses.

The cost of compressed air energy storage systems is the main factor impeding their commercialization and possible competition with other energy storage systems. For small scale compressed air energy storage systems volumetric expanders can be utilized due to their lower cost compared to other types of expanders.
