

What does the conversion efficiency of energy storage mean

How does a conversion device lose efficiency?

A conversion device can lose efficiency through a variety of means. Some devices intended to convert one form of energy to another lose energy as heat. An engine intended to convert chemical energy to work or motor power may, for instance, release some energy as heat.

How much energy does a storage system use?

This means 340 kWh conversion losses and 131 kWh losses due to self-consumption. The energy available from the storage system minus the losses is then $2,000 - 340 - 131 = 1,529$ kWh. In other words, the efficiency in this year is around 76.5 per cent. In principle, a higher degree of efficiency is desirable, as less energy is lost on the way.

It depends on the material of the cell. In the case of Silicon, exposed to solar radiation (without concentrating it), 22% of the energy of the AM 1.5 spectrum does not have enough energy to create the pair eh ; another 32% is lost because the photons have more energy than 1.11 eV. Therefore, only 49.6% of the energy (efficiency) could be converted.
