Energy storage systems are essential to the operation of electrical energy systems.

How is energy storage power station distributed?

The energy storage power station is dynamically distributed according to the chargeable/dischargeable capacity, the critical over-charging ES 1# reversely discharges 0.1 MW, and the ES 2# multi-absorption power is 1.1 MW. The system has rich power of 0.7MW in 1.5-2.5 s.

What happens when energy storage absorption power is in critical state?

When the energy storage absorption power of the system is in critical state, the over-charged energy storage power station can absorb the multi-charged energy storage of other energy storage power stations and still maintain the discharge state, so as to avoid the occurrence of over-charged event and improve the stability of the black-start system.

How energy storage system works?

Application of an energy storage system can coordinate a grid to accommodate wind power maximally. Furthermore, energy storage device can absorb the renewable generation in "off peak" load period, and conduct the peak shaving in "peak" load period.
