What is independent photovoltaic power generation system?

The independent photovoltaic power generation system is an independent power generation system compared to the grid-connected power generation system. The stand-alone system is mainly used in remote areas without electricity, and the main purpose of its construction is to solve the problem of no electricity.

How does a photovoltaic power generation system work?

Typically, the independent photovoltaic power generation system is mainly composed of solar arrays, solar controllers, and storage batteries. When there is sunlight, the photovoltaic power generation array provides power to the load and charges the battery. In other cases, the battery provides power to the load.

What is a municipal supplementary photovoltaic power generation system?

The municipal supplementary photovoltaic power generation system is based on solar power generation in an independent photovoltaic power generation system, supplemented by ordinary 220V alternating current supplementary electric energy.

How many kilowatts is a photovoltaic power station?

At present, the capacity scale of independent photovoltaic power stations is from a few kilowatts to tens of kilowatts. The power station consists of an array of photovoltaic panels, batteries and inverters, and a distribution and transmission system.

What are the structural units of a solar power generation system?

The basic structural units of the power supply part of the solar power generation system include: photovoltaic array, battery and controller. Solar energy is a type of radiant energy that must be converted into electricity with the help of an energy converter, which is called a .

How does a DC photovoltaic system work?
