What is solar air conditioning?

Solar air conditioning is any air conditioning powered by the sun's energy. These systems have no emissions and supply their own energy, allowing customers to lessen their carbon footprint and reduce their energy costs at the same time.

What is a solar thermal air conditioner?

A solar thermal air conditioner is a type of air conditioner that uses solar energy to heat water. This hot water then turns a refrigerant from liquid to gas, which absorbs heat when it condenses, providing cool air for air conditioning.

Are solar air conditioners a good idea?

Solar air conditioners are a good idea for several reasons. They have no emissions and supply their own energy, allowing customers to lessen their carbon footprint and reduce their energy costs. Air conditioning accounts for roughly 12% of home electricity use in the United States and annually releases an estimated 117 million metric tons of carbon dioxide into the atmosphere.

How do solar air conditioners reduce emissions?

Solar air conditioners have no emissions and supply their own energy, so customers can lessen their carbon footprint and reduce their energy costs at the same time.

What does a simple solar air conditioning system cool?

The simplest form of solar air conditioning is a small solar panel that generates enough electricity to run a fan--for example, to cool an attic. More advanced and powerful systems use air conditioners that run just like any window air conditioner--by transferring heat from one place to another using refrigerants, coils, and a compressor.

How can you run an air conditioner at night with a solar PV system?

A "hybrid" solar PV air conditioning system allows you to run the air conditioner off of your solar panels during the day but plug it into a normal household outlet to run it at night.
