Global electricity generation is heavily dependent on fossil fuel-based energy sources such as coal, natural gas, and liquid fuels. There are two major concerns with the use of these energy sources: the impending exhaustion of fossil fuels, predicted to run out in <100 years [1], and the release of greenhouse gases (GHGs) and other pollutants that adversely affect ...

However, the cost is still the main bottleneck to constrain the development of the energy storage technology. The purchase price of energy storage devices is so expensive that the cost of PV charging stations installing the energy storage devices is too high, and the use of retired electric vehicle batteries can reduce the cost of the PV combined energy storage ...

The enumerative approach systematically goes through a defined range of storage sizes, simulates the storage behavior at each size, and then selects the best-performing size [5]. Yang et al. used an enumerative method to size solar photovoltaics (PV), wind turbines, and battery banks for a telecommunication relay station [6]. The method iterates through ranges of ...

According to the SOC of energy storage battery, when the price of PV energy which is sold back to grid (Price-PV) is higher than the price difference between the time t and peak time, the surplus PV power generation will preferentially be sold to the grid; otherwise it will be charged for the energy storage system.
