

What is the energy content of a storage fluid?

For a storage fluid which is thermally stratified with a linear temperature profile in the vertical direction, the energy content can be shown with Eqs. (9.72) and (9.82) to be where  $T_t$  and  $T_b$  are the storage-fluid temperatures at the top and bottom of the linearly stratified storage tank, respectively.

Which heat storage material is the best choice?

When choosing a heat storage material for a system, it's crucial to consider thermal stability, material properties, and cost. For the sake of system robustness, the best choice depends on a careful consideration of these factors, which limits the options greatly.

How does liquid storage improve PTEs efficiency?

PTES with liquid storage transfers large quantities of energy through heat exchangers. Costs and efficiencies are improved by using a working fluid with a high heat transfer coefficient, and previous work has suggested the use of nitrogen, helium, and hydrogen (Farr et al., 2018).

What is the energy content of a linearly stratified storage fluid?

For a storage fluid which is thermally stratified with a linear temperature profile in the vertical direction, the energy content can be shown with Eqs. (9.72) and (9.82) to be where  $T_t$  and  $T_b$  are the storage fluid temperatures at the top and bottom of the linearly stratified storage tank, respectively.

What is energy-rich fluid used for?

When an energy demand occurs, the energy-rich fluid can be used to power a building's water heater, dishwasher, clothes dryer, and much more. There could be industrial applications as well, including low-temperature heat used for cooking, sterilization, bleaching, and distillation.

How much thermal energy can be stored in a gallon?

With water as the working fluid, 8.34 Btu (8.80 kJ) of thermal energy can be stored in one gallon for 1°F (0.56°C) of temperature change. Chilled water storage systems are typically designed for at least a 20°F (11.1°C) temperature differential which yields a storage density of approximately 0.1 ton-h/ft<sup>3</sup> (12.4 kWh/m<sup>3</sup>).
