What is solar storage and how does it work?

Solar storage is a system that stores excess electricity produced by solar panels for later use. It works by converting the excess electricity into a form that can be stored, such as chemical energy in batteries. This stored energy can then be used whenever needed, including after the sun has set, acting as an insurance policy for sunshine.

What is energy storage?

Energy storage is a system that can help more effectively integrate solar into the energy landscape. Sometimes it is co-located with, or placed next to, a solar energy system, and sometimes it stands alone.

What is a photovoltaic/thermal (pv/T) system?

A photovoltaic/thermal (PV/T) system converts solar radiation into electrical and thermal energy. The incorporation of thermal collectors with PV technology can increase the overall efficiency of a PV system as thermal energy is produced as a by-product of the production of electrical energy.

When can stored solar energy be used?

When some of the electricity produced by the sun is put into storage, that electricity can be used whenever grid operators need it, including after the sun has set. In this way, storage acts as an insurance policy for sunshine.
