What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges from the grid or a power plant and then discharges that energy to provide electricity or other grid services when needed.

Who uses battery storage?

Battery storage is a technology that enables power system operators and utilities to store energy for later use.

What is the cycle life of a battery storage system?

Cycle life/lifetime is the amount of time or cycles a battery storage system can provide regular charging and discharging before failure or significant degradation. For example, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours.

What type of electricity do batteries use?

Batteries use DC (Direct Current). Although battery manufacturers often refer to the DC-DC efficiency, AC-AC efficiency is typically more important to utilities, as they only see the battery's charging and discharging from the point of interconnection to the power system, which uses AC (Denholm 2019).

What is a battery state of charge?

The battery remains on standby most of the time, only discharging during power outages. State of Charge (SoC) is a term used to describe the current charge level of a battery relative to its total capacity, expressed as a percentage. It helps to determine the available energy left in a battery during its discharge cycle.

What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability of a battery energy storage system (BESS), or the maximum rate of discharge it can achieve starting from a fully charged state. Storage duration, on the other hand, is the amount of time the BESS can discharge at its power capacity before depleting its energy capacity.
