What temperature should a battery be stored at?

Storing a battery at extreme temperatures below 0°C (32°F) or over 30°C (86°F) can harm its durability, capacity, efficiency, and performance. Therefore, it's recommended to avoid storing the battery at such temperatures. Always check the user manual/datasheet for specific battery storage instructions.

What temperature should a lithium battery be stored?

Proper storage of lithium batteries is crucial for preserving their performance and extending their lifespan. When not in use, experts recommend storing lithium batteries within a temperature range of -20°C to 25°C (-4°F to 77°F). Storing batteries within this range helps maintain their capacity and minimizes self-discharge rates.

How does storage temperature affect battery performance?

A high storage temperature increases the self-discharge rate of batteries, resulting in a rapid loss of stored capacity. This is harmful to the battery because the state of charge (SoC) dramatically influences battery life and performance. In addition, lead-acid batteries suffer the "memory effect".

What happens to battery capacity at high temperatures?

The high temperature effects will also lead to the performance degradation of the batteries, including the loss of capacity.

Why is temperature important when working with batteries?

Comparing the numbers between 42°C and 61°C, you can see a factor of 10 in reaction speed for a difference in temperature of just 19°C! So, temperature is a parameter which must not be neglected when working with batteries. An example for the significance of these effects on real batteries is shown in table

How does self-production of heat affect the temperature of lithium batteries?

The self-production of heat during operation can elevate the temperature of lithium-ion batteries (LIBs) from inside. The transfer of heat from the interior to the exterior of batteries is difficult due to the multilayered structures and low coefficients of thermal conductivity of battery components.
