Compressed air energy storage or simply CAES is one of the many ways that energy can be stored during times of high production for use at a time when there is high electricity demand.

What is the typical pressure used in compressed air energy storage?

During the operation, excess electricity is used to compress the air into a salt cavern located underground, typically at depths of 500-800 m and under pressures of up to 100 bars. Diabatic storage systems utilize most of the heat using compression with intercoolers in an energy storage system underground.
