The EMALS promised to be more efficient, more reliable, and more cost-effective than the old steam-powered system.

What is a launch control system for electromagnetic catapults?

The launch control system for electromagnetic catapults, on the other hand, will know what speed an aircraft should have at any point during the launch sequence, and can make adjustments during the process to ensure that an aircraft will be within 3 mph of the desired takeoff speed.

over the limitations of a conventional steam catapult system. However, all these advantages come at a price. A major limitation of using EMALS catapult will be the huge quantity of electric energy required to generate the required magnetic field.
