What is the difference between a battery and a capacitor?

Compared to batteries, capacitors have a lower energy density, storing less energy per unit of volume or mass. This makes them less suitable for long-duration energy storage. Another key difference is the self-discharge property: capacitors tend to lose their stored energy relatively quickly when not in use.

Stored energy in two series capacitors, charged to voltage 2V: There is no difference! Both circuits store the same amount of energy. This should confirm a common-sense approach, that would say you can't increase total energy storage merely by reconnecting the same capacitors in different arrangements. Conclusions

Power systems are undergoing a significant transformation around the globe.
