

How can hydrogen be used as an energy storage medium?

Hydrogen as an energy storage medium provides an alternative pathway that not only helps to integrate renewable power generation, but also enables the decarbonization of the transportation and natural-gas sectors. Renewable wind and solar technologies are bringing power to millions across the world with little-to-no adverse environmental impacts.

The capacity of hydrogen energy storage is limited only by the volume and number of installed high-pressure balloons. The technology of hybrid systems based on wind turbines and hydrogen energy storage systems is at an early stage of development.

Are hybrid systems based on wind turbines and hydrogen energy storage systems possible?

The technology of hybrid systems based on wind turbines and hydrogen energy storage systems is at an early stage of development. Still, today many countries of the European Union rely on hydrogen in their energy decarbonization programs [21].

Is a hydrogen storage system a good choice?

The research [23] shows that a system consisting of a WT, a fuel cell, an electrolyzer, and a hydrogen storage system may be the best choice (Newfoundland is considered), but there is a high investment due to the high cost of fuel cells.

How much power does a wind turbine use?

Wind turbines (WT) utilize installed capacity in the range of 20-37%, depending on the geographical conditions of the region [2,3]. It is possible to reduce the negative impact of this factor by using energy storage systems and optimizing the real-time electricity flows control for generating consumers (GC or prosumers).

What is wind energy storage? 1. Wind energy is one of the most abundant renewable energy sources, but wind energy is unpredictable and unstable, which makes it impossible to make full use of wind energy. With the development of energy storage technology, it is more efficient to connect wind turbines with storage devices, which can efficiently store the ...

If the growth needed in the installed capacity of wind and solar is huge, when compared to the starting point [21], the major hurdle is however the energy storage [22, 23]. Wind and solar energy are produced when there is a resource, and not when it is demanded by the power grid, and it is strongly affected by the season, especially for what concerns solar.
