What is the rate of energy storage in a Magnetic Inductor?

Thus,the power delivered to the inductor $p = v \cdot i$ is also zero,which means that the rate of energy storage is zero as well. Therefore,the energy is only stored inside the inductor before its current reaches its maximum steady-state value, I_m . After the current becomes constant,the energy within the magnetic becomes constant as well.

How does an inductor work?

The inductor behaves like a load and stores energy to prevent ripples from producing excess current. It acts like a current supply when the ripple reduces the current value. In each case,the inductor prevents the ripples from influencing the regulated DC.

How does a SMPS inductor work?

The inductor subdues any output current fluctuations by changing its behavior between a load and a supply based on the SMPS current ripple. The inductor behaves like a load and stores energy to prevent ripples from producing excess current. It acts like a current supply when the ripple reduces the current value.

Why are self-induction and mutual eddy currents undesirable?

Self-induction and mutual induction due to the inductor's magnetic field can cause eddy currents to flow in the body of the inductor and any nearby conductors. These are undesirable because they produce mechanical stress,heat,and energy losses.

What are the characteristics of a practical inductor?

The exponentialcharacteristics of a practical inductor differ from the linear behavior of ideal inductors; both store energy similarly-by building up their magnetic fields. These magnetic fields have undesirable effects on the inductors and nearby conductors,causing several safety hazards.

What happens when an excited inductor loses connection to the supply?

When an excited inductor loses connection to the supply,it quickly breaks its magnetic fieldsand tries to continue the connection to the supply with the converted energy. This energy can cause destructive arcing around the point where the connection is lost. Thus,the connectivity of the circuit must be continuously observed.
