How does a flywheel energy storage system work?

Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm. Electrical energy is thus converted to kinetic energy for storage. For discharging, the motor acts as a generator, braking the rotor to produce electricity.

What is electromechanical storage system?

electromechanical storage system in which energy is stored in the kinetic energy of a rotating mass. Flywheel systems are composed of various materials including those with steel flywheel rotors and resin/glass or resin/carbon-fiber composite rotors.

What is the kinetic energy stored in the rotor?

The total kinetic energy stored in the rotor can be expressed as  $E_k = \frac{1}{2} I \omega^2$  where  $I_{zz}$  is the rotational mass moment of inertia. It was assumed that the rotation of the flywheel is purely about the z-axis with a rotational velocity  $\omega$ . with the masses  $m_j$ , the rotor height  $h$  and the constant density  $\rho_j$  of each rim.

Can a single-material flywheel rotor increase energy storage capacity?

Ha et al. (1998) optimized the design of a single-material multi-rim flywheel rotor with interferences and different fiber angle in each rim. They were able to increase the energy storage capacity by a factor of 2.4 compared to a rotor without interferences and purely circumferentially wound fibers.

How kinetic energy is stored in a flywheel?

Electric energy is supplied into flywheel energy storage systems (FESS) and stored as kinetic energy. Kinetic energy is defined as the "energy of motion," in this situation, the motion of a rotating mass known as a rotor, rotates in a near-frictionless environment.

How much energy does a rotor store?

At 6400 rpm, each of the four rotors will store 121 MJ (34 kWh). In 45 seconds, they can store 122 MJ (34 kWh) and release it in 2-3 seconds. The flywheel energy densities are 28 kJ/kg (8 Wh/kg), omitting the torque frame, and 18.1 kJ/kg (5 Wh/kg) with the stators and casings.
