

Can zirconium oxide be used as a supercapacitor electrode?

Among various oxides, zirconium oxide (ZrO_2) finds vast applications due to its features such as high melting point, non-toxic nature and corrosion-free property [10-13]. However, the instability as well as a higher electrical resistance retards its use as an electrode for supercapacitor applications.

Does silver coating improve electrochemical performance of zirconia nanoparticles?

The phase, purity as well as the morphology of the materials were confirmed by XRD, UV/Visible, EDX, SEM and TEM techniques. Silver coating effectively improved the electrochemical performance of zirconia nanoparticles, which was due to the enhancement of electrical conductivity and specific surface area of zirconia nanoparticles.

Does silver-coated zirconia have a peak of AG?

(a) while in silver-coated zirconia, an additional peak of Ag was also observed. The absence of the peak for any other element in the synthesized materials confirmed the purity of these materials. The surface area, pore volume and pore size were determined by the nitrogen adsorption-desorption isotherm.

What is the specific capacitance of silver-coated zirconia?

The silver-coated zirconia showed higher specific capacitance of 792 F/g at 10 mV/s as compared to individual zirconia (10.22 F/g). Silver-coated ZrO_2 also showed good power density of 274.5 W/kg at current density of 5 mA/cm² through the galvanostatic charge discharge profile.

Is silver-coated ZrO_2 more conductive than simple zirconia?

So, it can be inferred that silver-coated ZrO_2 is more conductive in nature as compared to simple zirconia and stimulates the electrochemical performance [32,33]. 4. Conclusion Silver-coated ZrO_2 nanoparticles as an electrode structure were synthesized successfully using two step methods, i.e. simple co-precipitation and the reduction method.

Can silver-coated ZrO_2 be used as a supercapacitor electrode material?

Hence, the results suggest that silver-coated ZrO_2 showed improved electrochemical performance as compared to individual ZrO_2 due to higher electrical conductivity and specific surface area. Hence, silver-coated ZrO_2 nanoparticles can be employed as an electrode material for supercapacitor applications.

1. Introduction
The lead oxide is harmful to human body as well as environment due to its volatility and toxicity nature during preparation process of the material [1]. Hence, there is a serious need to grow environment-friendly materials with first-rate ferroelectric properties to replace the lead-based ceramics [2]. Barium titanate (BaTiO_3) is one of the best lead-free ceramic material ...

Zirconium is generally considered to be inactive electrochemically, especially in reducing environments. This property makes it useful in applications where electrochemical reactions could be detrimental, such as in certain types of fuel cells. Abundance and Sources - Zirconium is typically found in mineral deposits like zircon and baddeleyite.

The increasing demand for sustainable energy solutions has prompted a significant interest in non-conventional energy sources, leading to the development of innovative materials that can enhance energy
